

Asthma 2013: Clinical Highlights and Controversies

Jay Peters, M. D.

Pulmonary / Critical Care Medicine

University of Texas Health Science Center - San Antonio

Disclosures/Conflict of Interest

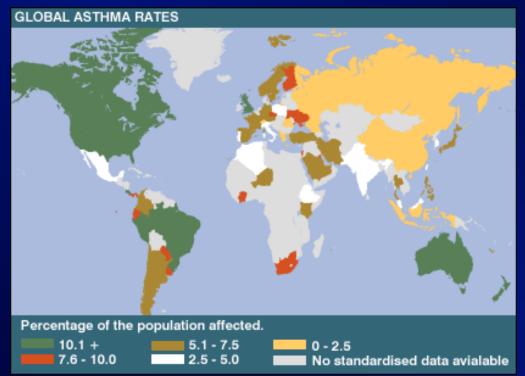

Grant support: NIH, NIAID, Texas Ignition

Fund Award

Speakers Bureau: None

Trends of Asthma Morbidity/ Mortality

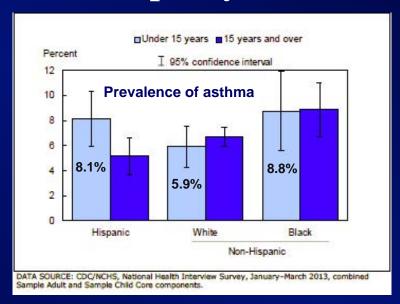

Asthma: more common in developed countries Exacerbations more common in:

- Minority populations
- Lower socio-economic groups

Asthma Facts: Each Day

- **❖** 44,000 asthma attacks
- ❖ 4,700 visit E.D. with asthma
- **❖** 1,200 admitted to a hospital
- ❖ 9 people die from asthma

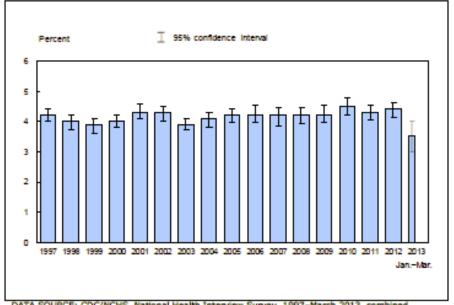

Racial Disparity in U.S.

Asthma Trends: CDC posting May 2013

Time to be optimistic?

Figure 15.1. Percentage of persons of all ages who experienced an asthma episode in the past 12 months: United States, 1997–March 2013

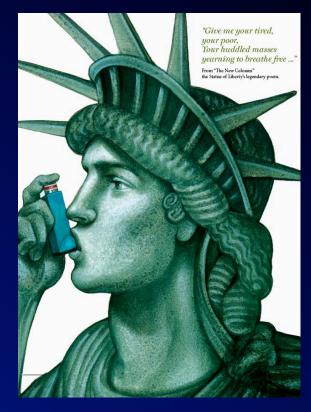

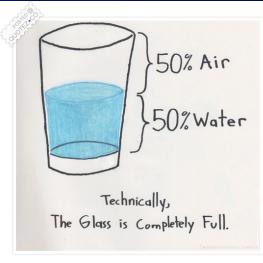

DATA SOURCE: CDC/NCHS, National Health Interview Survey, 1997–March 2013, combined Sample Adult and Sample Child Core components.

National Health Interview Survey (NHIS)

- Prevalence of current asthma increased: 2003 vs. 2012 = 7.1% vs. 8.5 %
- Percentage with exacerbation fell 8.5% to 6.8%

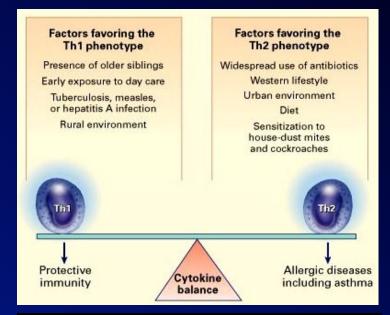

Still 3,285 unnecessary asthma deaths!

Asthma is a Complex Disease

- Genetics of asthma
 - One parent: risk 1/3
 - Both parents: risk 7/10
 - Identical twin: only 50-70%
- Environment & asthma
 - Increased risk: western
 lifestyles, use of antibiotics and
 vaccines, allergen exposure
 - Decreased risk: large number of siblings, rural environment
- Timing: early vs. late exposure (e.g. cats, infection)

Evolution of Asthma Paradigms

1970s-1980s

Bronchoconstriction (Spirometry)

1980s-1990s

Inflammation (PC₂₀, Inflam cells, FeNO)

1990s-2000s

Remodeling

The Airway Microenvironment in Asthma

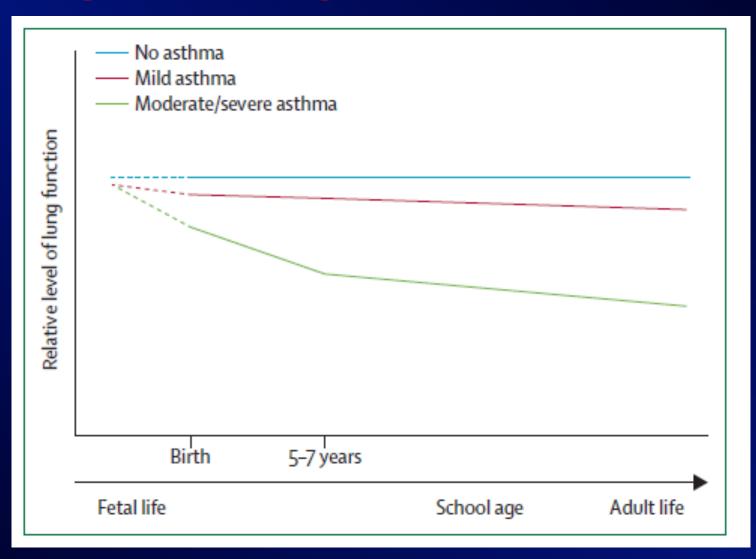

Basement Membrane Thickening

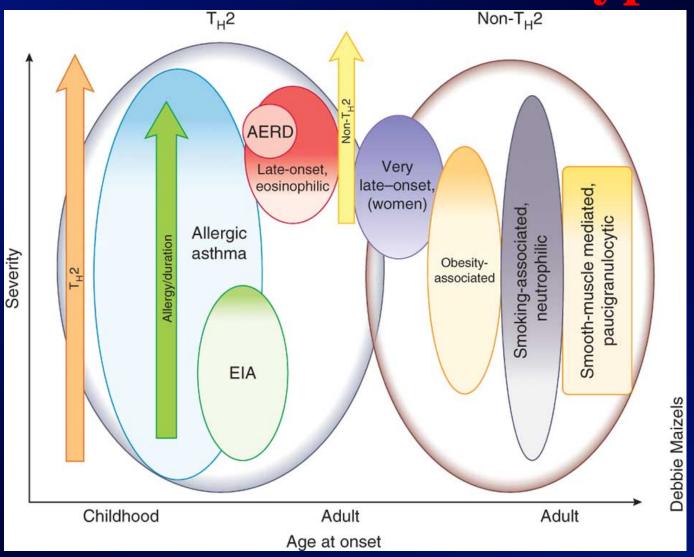

Jeffery P. In: Asthma, Academic Press 1998

Changes in Lung Function in Asthma

Clinical Asthma Phenotypes

Asthma Phenotypes

- Early onset asthma: ≤ 12 yrs old
 - Atopic (elevated IgE levels): skin, nasal, & lung involvement
 - Eosinophilic inflammation; allergy driven/responsive
- Adult onset asthma: > 18 yrs old (mean 54; range 26-75)
 - Group 1: Eos +; persistent airflow obstruction; low Sx score
 - Group 2: Obese females, low Eos, high Sx score/health costs
 - Group 3: Mild-moderate asthma, nl lung function and low inflammatory markers
- Severe asthma phenotype
 - Disease moves more distal in airways
 - Neutrophils and mast cells in terminal airways

Allergy 68 (5),674-80 (May 2013)

The Asthma Syndrome

Symptoms of asthma, episodic breathlessness, wheeze, cough

Asthma Endotypes

Distinct disease entities which may be present in clusters of phenotypes and each having a specific biological mechanism

Endotype 1 Allergen driven Endotype 2 Severe eosinophilic non-allergic Endotype 3 Noneosinophilic Endotype 4 Noninflammatory Endotypes not yet identified or rare

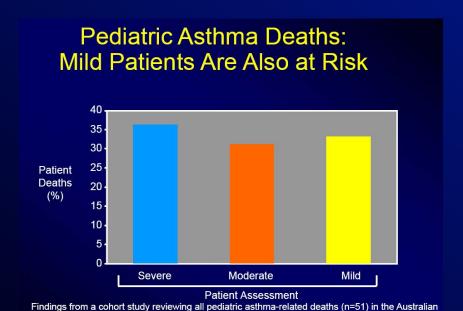

Asthma endotypes: A new approach to classification of disease entities within the asthma syndrome

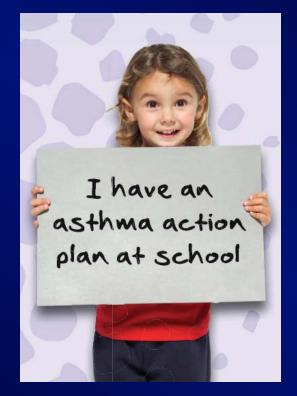

Jan Lötvall, MD,^a Cezmi A. Akdis, MD,^b Leonard B. Bacharier, MD,^c Leif Bjermer, MD,^d Thomas B. Casale, MD,^e Adnan Custovic, MD,^f Robert F. Lemanske, Jr, MD,^g Andrew J. Wardlaw, MD,^h Sally E. Wenzel, MD,ⁱ and Paul A. Greenberger, MD^j Göteborg and Lund, Sweden, Davos, Switzerland, St Louis, Mo, Omaha, Neb, Manchester and Leicester, United Kingdom, Madison, Wis, Pittsburgh, Pa, and Chicago, Ill

#1 Cause of Asthma Deaths

- Noncompliance
 - Lack of asthma education (both patients/MDs)
 - Failure to prescribe/use controller medications
- Belief that asthma deaths only occur in patients

with severe asthma

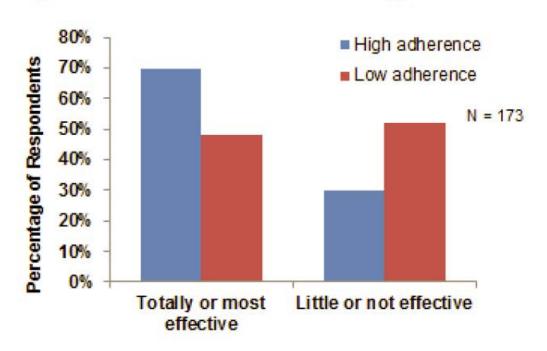

obertson et al. Pediatr Pulmonol. 1992;13:95-100.

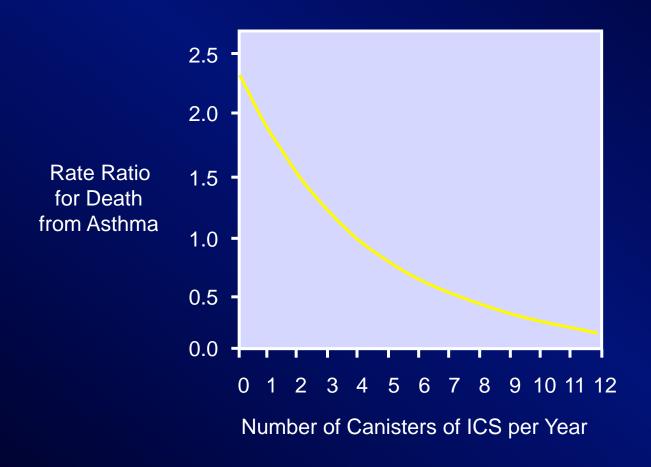

Patient Education/Beliefs Can Prevent Asthma Deaths

Patient-related Factors: Belief in Treatment Efficacy Is Associated With Higher Adherence

Khdour MR, et al. Eur J Olin Pharmacol. 2012;68(10):1365-1373.

Low-dose ICS: Prevention of Death from Asthma

Education About the Environment

- Allergens avoidance in asthma:
 - House dust mite
 - Cat dander
 - Cockroach antigen
 - Alterneria/fungi
- Most forgotten component in asthma education

Mites

Cockroach

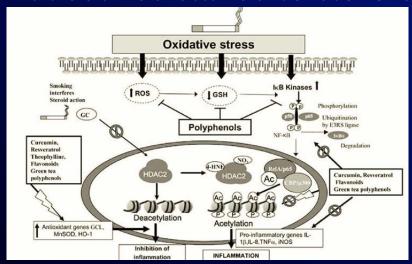

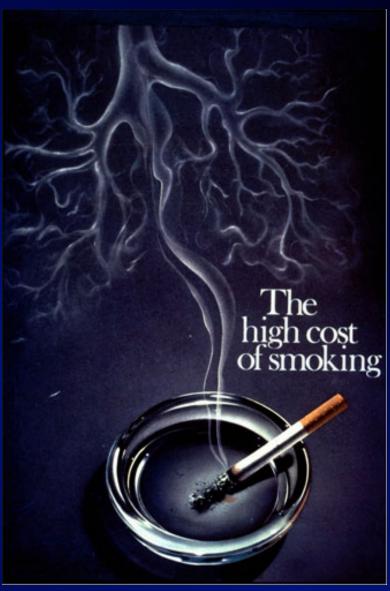

Fungi

Cat

Smoking Cessation/Eliminate ETS

- Over 20% of asthmatics smoke
- Cigarette smoke:
 - Increases mucous production
 - Causes destruction of cilia
 - Induces bronchospasm
- ETS has been shown to be equally detrimental as smoking
- Induces resistance to steroids

Eur Respir J 2009; 33:1010–1017

Risk Factors for Severe Asthma Exacerbation

- Equal among mild, moderate, and severe asthma*
- Key risk factors:
 - Ever been intubated or in ICU for asthma
 - Hospitalized in last year
 - Deficiency in self-management skills
- Predictors of health care utilization:
 - Score of < 20 on Asthma Control Test (ACT)
 - Poor perception of dyspnea

Factors Influencing the Heterogeneity of Asthma Control: Poor Perception of Dyspnea (POD)

113 Asthmatics Evaluated

- Breathe against 2-way valve load of 0-, 5-, 10-, 20-, and 30-cm H₂O for 1 minute
- Dyspnea defined as modified Borg scale
- POD
 - Low 29 (26%)
 - Normal 67 (59%)
 - High 17 (15%)

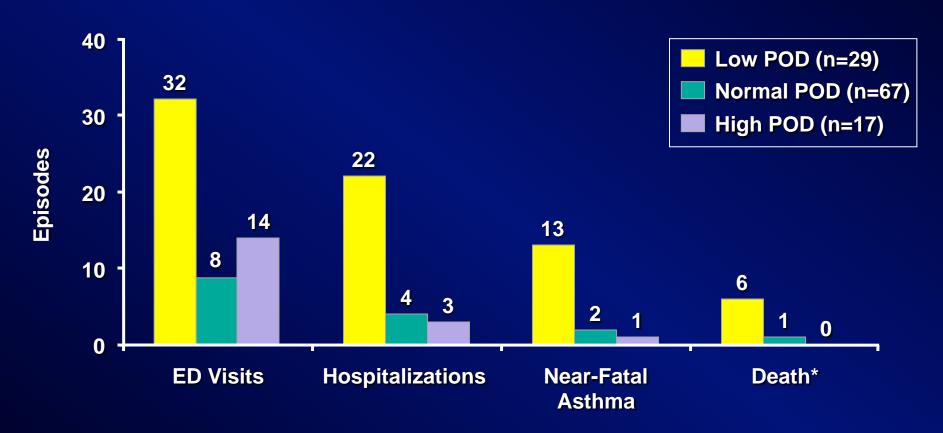

- Low 1.7/day
- Normal 2.4/day
- High 4.1/day
- Patients with asthma and a low POD had tendency toward
 - Older age
 - More females
 - Longer duration
 - More severe
- Documented events over 2 years

Magadle R et al. Chest. 2002;121:329-333.

β₂-Agonist use in 4 weeks*

^{*}Puffs/day.

Poor Perception of Dyspnea (POD)

*Of deaths in the low POD group, 4 were asthma related, 2 were unknown.

Multiple studies now that show underpercievers and life-threatening asthma may have a 20%

mortality from asthma

Asthma Control Test[™] (ACT)

1.	In the past 4 weeks, how much of the time did your asthma keep you from getting as much done at work, school, or at home?				
	All of the time 2 Some of the time 3 A little of the time 5				
2.	During the past 4 weeks, how often have you had shortness of breath?				
	More than once a day Once 2 3 to 6 times 3 Once or twice a week 4 Not at all 5				
3.	3. During the past 4 weeks, how often did your asthma symptoms (wheezing, coughing, shortness of breath, chest tightness, or pain) wake you up at night, or earlier than usual in the morning?				
	4 or more nights a week 2 Once a week 3 Once or twice 4 Not at all 5				
4. During the past 4 weeks, how often have you used your rescue inhaler or nebulizer medication (such as albuterol)?					
	3 or more times per day 1 1 or 2 times per day 2 2 or 3 times per week 3 Once a week or less 4 Not at all 5				
5.	How would you rate your asthma control during the past 4 weeks?				
	Not controlled at all 1 Poorly 2 Somewhat 3 Well 4 Completely controlled 5				
	ll controlled ≥ 20; 16-19 not well controlled, ≤ 15 very poorly controlled Patient Total Score ailable at: http://www.asthmacontrol.com.				

ACT < 20 best predictor of asthma control

ASTHMA 2013

- Maximizing therapy
- Controversies in asthma care

What is Persistent Asthma?

- ➤ Use of rescue inhaler each week
- Nocturnal awakenings/ month
- Number of canisters per year of rescue medications
 - ➤ More reliable index
 - Two puffs 3x/week = 3.3 canisters/year

STRIKE 3. YOU'RE OUT!

Signs That Your Asthma Is Persistent And May Be Out Of Control

STRIKE 3

You are using a rescue inhaler 3 or more times a week.

You are using 3 or more canisters of rescue medication a year.

STRIKE 3

STRIKE 3

You are awakening at night 3 or more times a month.

ANY

STRIKE 3

means that you have persistent asthma that may be out of control.

Ask your Doctor about an anti-inflammatory or controller medication.

www.texasasthma.org 0.2000 UTHSCSA

NAEPP Guidelines to the Management of Asthma

FIGURE 4-5. STEPWISE APPROACH FOR MANAGING ASTHMA IN YOUTHS ≥12 YEARS OF AGE AND ADULTS

Intermittent Asthma

Persistent Asthma: Daily Medication

Consult with asthma specialist if step 4 care or higher is required. Consider consultation at step 3.

Step 5

Preferred:

High-dose ICS + LABA

AND

Consider Omalizumab for patients who have allergies

Step 6

Preferred:

High-dose ICS + LABA + oral corticosteroid

AND

Consider Omalizumab for patients who have allergies

Step up if needed

(first, check adherence. environmental control, and comorbid conditions)

> Assess control

Step down if possible

(and asthma is well controlled at least 3 months)

Step 1

Preferred: SABA PRN

Step 2

Preferred: Low-dose ICS

Alternative:

Cromolyn, LTRA. Nedocromil, or Theophylline

Step 3

Preferred: Low-dose ICS + LABA

Medium-dose ICS

Alternative:

Low-dose ICS + either LTRA. Theophylline, or Zileuton

Step 4

Preferred:

Medium-dose ICS + LABA

Alternative:

Medium-dose ICS + either LTRA. Theophylline, or Zileuton

Each step: Patient education, environmental control, and management of comorbidities.

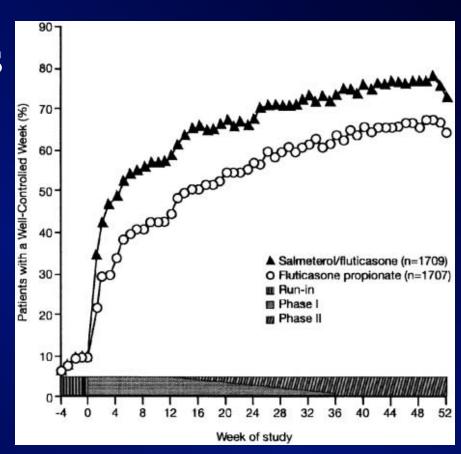

Consider subcutaneous allergen immunotherapy for patients who have allergic asthma (see notes).

Quick-Relief Medication for All Patients

- SABA as needed for symptoms. Intensity of treatment depends on severity of symptoms: up to 3 treatments at 20-minute intervals as needed. Short course of oral systemic corticosteroids may be needed.
- Use of SABA > 2 days a week for symptom relief (not prevention of EIB) generally indicates inadequate control and the need to step up treatment.

Can Guideline-defined Asthma Control Be Achieved?

- GOAL Study: Double blind RCT
 - Steroid naive or "low" dose ICS
 - Age 12-80 (n = 3421)
- Total control =31%
- Well controlled = 59-71%
- Prednisone .5 mg/kg x10 days improved control by 5-10%
- Exacerbation rate $\approx 10\%$
- Conclusion: <u>20%</u> not well controlled on steroids/LABA

Theophylline

> Rationale:

- Long-acting bronchodilator by non-selective inhibition of phosphodiesterases
- Anti-inflammatory effects:
 - ■ Infiltration of lymphocytes and eosinophils into the airway
 - T-cell proliferative response cytokine production.
 - Apoptosis of eosinophils

Sullivan P, et al. Lancet 1994; 343: 1006-8.

Ohta K, et al. Clin Exp Allergy 1996;26(Suppl 2):10-5.

Ito K, et al. Proc Natl Acad Sci U S A 2002;99:8921-6.

Theophylline

- \triangleright Spears M, et al. Eur Resp J. 2009 (n = 68)
 - ICS vs. theophylline + ICS vs. theophylline alone. In asthmatic *smokers*.
 - The combination of the ophylline + ICS provided the best results improving ACQ scores and pulmonary function.
- Nie H, et al. Resp Med. 2013 (n = 325)
 - ICS/LABA + theophylline vs. ICS/LABA + placebo in a randomized, parallel-group study (24 weeks)
 - Patients receiving the ophylline had fewer exacerbations (≥ 1) 30 vs. 47 % (p = 0.004).
 - Theophylline group had significant decreased in sputum eosinophils and eosinophilic cationic protein.

Theophylline

>Pros:

- Modest bronchodilation
- Possible anti inflammatory effects
- Possible reversal of steroid resistance
- Convenient dosing
- Potentially more beneficial in asthmatic smokers

Cons:

- Need to monitor levels
- Potentially severe side effects
- Interaction with other medications
- Limited evidence of effectiveness

Long acting muscarinic antagonists

✓ Rationale:

 Activation of the parasympathetic (acetylcholine) system causes bronchoconstriction, bronchial vasodilation and mucus secretion. Asthma may cause increased parasympathetic afferent stimulation.

✓ Approved for COPD:

- Tiotropium: reduces smooth muscle contraction and mucus secretion.
- Aclidinium: newly approved. Few data on asthma.

Tiotropium Bromide Step-Up Therapy for Adults with Uncontrolled Asthma

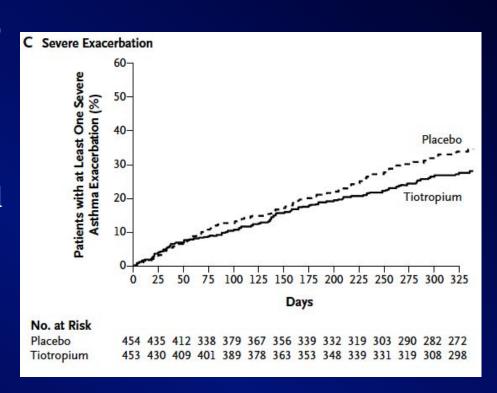

- TALC study
 - Poorly controlled on ICS
 - Double ICS
 - LABA (salmeterol)
 - LAMA (Tio)
- Primary endpoints
 - PEFR
 - FEV₁
 - Asthma control days
- LAMA = LABA $> \uparrow$ ICS
- No long term data; select subset of subjects

N Engl J Med 2010;363:1715-26 October 28,2010

Long acting muscarinic antagonists

- Kerstjens et al. J Allergy Clin Immunol. 2011 (n = 107)
 - Tiotropium as an add-on to ICS + LABA.
 - Poorly controlled, severe
 asthma: tiotropium improved
 FEV₁ over 24 hrs
- Kerstjens et al. (n = 912)
 - Increased time to first exacerbation by 56 days
 - 21% reduction in the risk of a severe exacerbation*

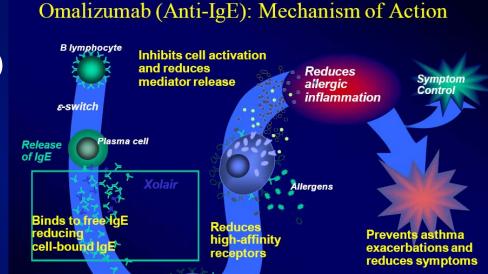

NEJM 2012;1198-1207

* Note: "Severe" = Double ICS x 3 days FEV1 increased 88 +/- 31 ml Is this clinically meaningful?

Omalizumab: Indications

- Patients with allergic asthma ages 12 years & older (6 years old: Europe)
- Step 5-6 NAEPP Guidelines -2007
- IgE level: 30-700 IU/ml
- One positive perennial antigen by skin test or RAST/Immunocap

Omalizumab

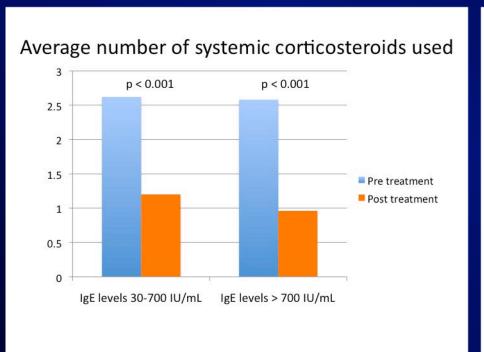

Evidence:

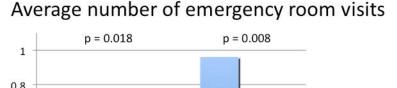

- Multiple studies have shown efficacy in:
 - ✓ **Quality of life**
 - ✓ **U** Exacerbations
 - ✓ **U** ER visits
 - Hospitalizations

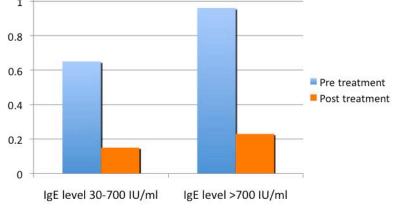

Busse W, et al. J Allergy Clin Immunol. 2001 Aug;108(2):184-90. Solèr M, et al. Eur Respir J. 2001 Aug;18(2):254-61. Holgate S, et al.. J Allergy Clin Immunol. 2005 Mar;115(3):459-65. Humbert M, et al. Allergy. 2005 Mar;60(3):309-16. Hanania NA, et al. Ann Intern Med. 2011 May 3;154(9):573-82.

Omalizumab

Omalizumab in patients with IgE levels of 30-700 vs. above 700 IU/ml (n = 52)

Maselli D, Peters J, et al. Ann Allergy Asthma Immunol. 2013 Jun;110(6):457-61.

Omalizumab

>Pros:

• Clear evidence of ♥ of exacerbations, ER visits, hospitalization & oral steroid requirements

>Cons:

- High cost
- Frequent visits required (every 2-4 weeks)
- Subcutaneous dosing
- Not clear when to stop therapy
- Possibly limited therapeutic window

ASTHMA 2013

- Maximizing therapy
- Controversies in asthma care

Measurement of Nitric Oxide? ATS Guidelines

- < 25 ppb (20 ppb in children) eosinophilic inflammation and responsiveness to corticosteroids are less likely
- >50 ppb (> 35 ppb in children) eosinophilic inflammation and responsiveness to corticosteroids in sx patients is more likely
- 25-50 ppb (20–35 ppb in children) depends on the clinical context

Reasons to Measure Nitric Oxide

- Identify the eosinophilic asthma phenotype
- Assess potential response or failure to ICS
- Assist in the evaluation of adherence to antiinflammatory medications
- Guide changes in doses of anti-inflammatory medications
- Studies have not been able to show FENO impacts lung function, QOL, or rate of asthma exacerbations but increased ICS use

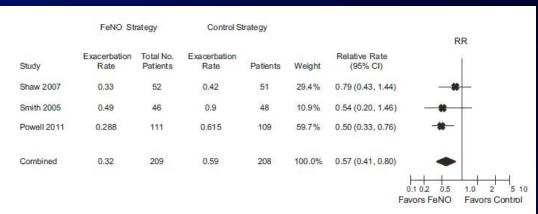

Use of FENO in Management of Asthma: Pro

• Initial studies:

- Often mild asthma
- Small numbers
- Evaluated number of pts with exacerbations

Donahue analysis

Evaluated total number of exacerbations

Reanalysis of Cochrane Studies

Step wise protocol for ICS management based on FENO				
Men	Women	ICS adjustment		
<19	<21	Decrease dose 1 step		
19-23	21-25	No change in ICS dose		
24-30	26-32	Increase dose 1 step		
>30	>32	Increase 2 steps		
	Men <19 19-23 24-30	Men Women <19		

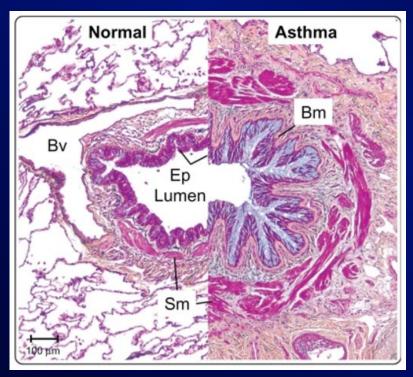

Ongoing study: using FENO to titrate ICS

Respir Med 2013;10(7):943-52

Bronchial thermoplasty (BT)

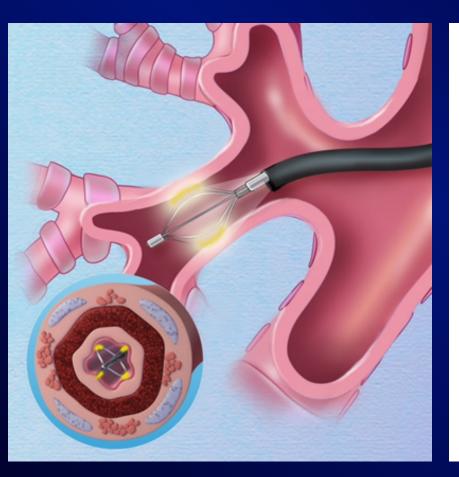

Rational or Irrational?

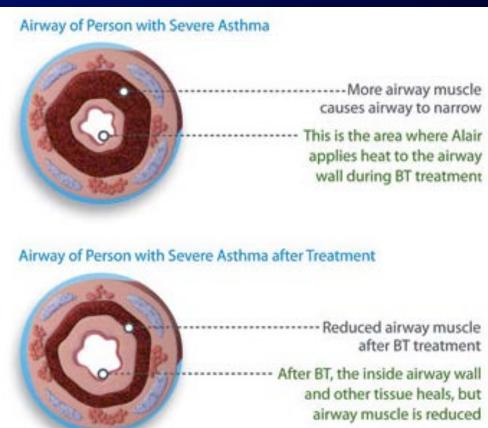

- Asthma: characterized by airway remodeling with s airway smooth muscle (ASM) hyperplasia/hypertrophy
- BT: can decrease significantly the ASM mass (via radiofrequency energy/ablation)

Airway remodeling

Bronchial thermoplasty

Bronchial thermoplasty

> Pros:

- Some evidence of reduction of symptoms
- Apparent lasting effects (≥ 5 years)

Cons:

- High cost
- Early exacerbation rate despite pretreatment with oral steroids
- Need for 3 bronchoscopies

Can Asthma Be Prevented?

• Concept: Maternal and epigenetic factors (how environment changes gene activity) are key factors in the development of allergy and asthma

• Current recommendations:

- Breast feed and avoid cow's milk first 4-6 months
- Use hydrolyzed formula if breast feeding not possible
- Avoid ETS during pregnancy and lactation

• Controversial data:

- Change infants microbiome (probiotics)
- Early introduction of peanuts & hen's eggs
- Early antigen avoidance (Isle of Wright Study)
